| **Imidicloprid**  
(Bayer Advanced Fruit-Citrus- 
Vegetable Insect Control) | Not Organic | Adult, Nymph, systemic | Drench soil once per year, according to label, for prevention and control of ACP for extended periods. | Other imidicloprid products marketed by Bayer are not labeled for citrus trees bearing fruit. Best time to apply is early summer post bloom as summer flushes commence. |
| **Malathion 50+%**  
Various manufacturers | Not Organic | Adult, Nymph | Approx. 3-4 tsp/Gallon  
(Follow product label rates accurately) | Broad-spectrum, contact-killing garden insecticide with short residual activity. |
| **Pyrethrum (pyrethrins)**  
(Bayer Advanced Natria Insect, 
Disease & Mite Control - 
contains sulfur also; Pyganic 
Crop Protection 5.0 & Pyganic 
Crop Protection 1.4; Safer 
Brand Yard & Garden Insect 
Killer with soap and pyrethrins) | Organic  
(most products, depending on secondary ingredients) | Adult, Nymph | Follow product label rates | Broad-spectrum, contact-killing insecticide with very short residual activity. Product should not be overused; may lead to mite problems. |
| **Azadirachtin** concentrate  
(active ingredient in Neem 
spray products- various manufacturers);  
applied like an insecticide. | Organic  
(most products, depending on secondary ingredients) | Repellant; suppression of psyllid population buildup.  
(Some curative or knockdown properties); very short residual | Follow label rates | Use in combination with other products, such as horticultural oils, insecticidal soaps or citrus peel oil products like Citri-King or Oro-Boost (active ingredient-alcohol ethoxylate). |
| **Clarified hydrophobic extract of Neem Oil** (Trilogy, other manufacturers) | Organic | Egg and nymph-effective.  
Adult — suppression only. | Follow label rates (0.5% to 2.0% solution in water or ½ to 2 oz/Gal. of water.) | Usage similar to horticultural oils and insecticidal soaps. Thorough coverage of tree needed. |

<tbody>
<tr>
<td>Horticultural petroleum oils—“Ultra-fine”/412 class (Sunspray Ultrafine, Saf-T-Side, several others)</td>
<td>Organic</td>
<td>Egg, Nymph, (Adult—suppression only)</td>
<td>1 to 2.5 oz/Gal of water (1% to 2.5% v/v). Use higher rates for heavy infestation situations</td>
<td>Apply thoroughly to well-watered plants at air temperatures below 95 °F. Can be applied during early bloom, but do not apply during late bloom/early fruit set period which may increase fruit abortion.</td>
</tr>
<tr>
<td>Soaps and insecticidal soaps (Safer Brand Insecticidal Soap, several others)</td>
<td>Organic</td>
<td>Nymph, adult</td>
<td>Approximately 1-2.5% rate (1-2.5 oz liquid hand or dish detergent/Gal. of water. For commercial insecticidal soaps, follow label rates.</td>
<td>Soap sprays require good coverage throughout the plant for effective control. Apply to plants that are well watered and at temperatures below 95 °F.</td>
</tr>
<tr>
<td>Kaolinite clay suspensions (Surround Crop Protectant)</td>
<td>Organic</td>
<td>Repellant</td>
<td>½ pound/Gal. of water</td>
<td>Must be re-applied after wash-off from rain or irrigation occurs</td>
</tr>

**Name-brand products listed are not an endorsement, but rather a guide for ease of locating the correct material for ACP control.

“Organic” means generally considered an organic/low toxicity control material. Approval for USDA-Certified Organic status or “OMRI-approved” is not implied and should be verified independently.

- Always follow the product label guidelines for mixing, handling, disposal, timing of application, preharvest interval, etc!

Asian Citrus Psyllid may infest a citrus tree throughout the year—Spring, Summer, Fall, Winter—and may re-infest trees days, weeks or months after treatment with one of the products listed here. Citrus growers should therefore monitor their trees regularly for the presence of eggs, larvae, and adult psyllids. Effective year-round control requires utilizing multiple control materials listed in this table. Horticultural oils, soaps, neem products, and kaolinite products may be used frequently to suppress the ACP population and prevent outbreaks. Insecticides like malathion, imidicloprid, and pyrethrum should be used judiciously/according to label recommendations to prevent development of insecticide-resistant psyllids. Imidicloprid is applied to the soil once per year, and acts systemically to prevent infestation of psyllids.

For assistance with proper identification of Asian Citrus Psyllids, control product selection, mixing, or application of insecticides, contact your County AgriLife Extension office:  http://agrilifeextension.tamu.edu
